

Summary

3 minutes

In this module, we used the Application Insights SDK to generate custom event telemetry from our video web app. We added a reference to the SDK to our project, configured the environment, initialized the SDK in code, and used `TrackEvent()` to track a custom, domain-specific event. This is a powerful tool that will allow you to track events and gain insights into your application usage.

Clean up

The sandbox automatically cleans up your resources when you're finished with this module.

When you're working in your own subscription, it's a good idea at the end of a project to identify whether you still need the resources you created. Resources left running can cost you money. You can delete resources individually or delete the resource group to delete the entire set of resources.
