Summary

2 minutes

In this module, you have learned how to create a custom Logic Apps connector. To connect Logic Apps to a custom REST API, describe that API by supplying a definition in OpenAPI format or a Postman collection. Then you can call functions in that API from Actions in any Logic App.

Now that you've created the connector, you can also use it to connect Microsoft Flow and PowerApps to your REST API.

Clean up

The sandbox automatically cleans up your resources when you're finished with this module.

When you're working in your own subscription, it's a good idea at the end of a project to identify whether you still need the resources you created. Resources left running can cost you money. You can delete resources individually or delete the resource group to delete the entire set of resources.
